Note: Within nine months from the publication of the mention of the grant of the European patent, any person may give notice to the European Patent Office of opposition to the European patent granted. Notice of opposition shall be filed in a written reasoned statement. It shall not be deemed to have been filed until the opposition fee has been paid. (Art. 99(1) European Patent Convention).

Description**TECHNICAL FIELD**

5 The present invention relates generally to an electronic brokerage system having a communication network connecting traders dealing in financial instruments, and more particularly to a computerized system for distributing anonymous price quotes on a selective basis in accordance with previously established credit limits.

BACKGROUND ART

10 European patent applications EP-A-0 399 850, EP-A-0 407 026, and EP-A-0 411 748 disclose an automated matching system for anonymous trading of foreign currencies (or other financial instruments) in which a single host computer maintains a central data base consisting of all the trading instruments available for trade, credit information, and the various bids and offers that are present throughout the system. The host computer uses the information in its central
 15 data base to match active bids and offers (as well as executing any transitory "hit bid" and "take offer" transactions) based on matching criteria which include the gross counterparty credit limit between counterparties to a potential matching transaction, price, and available quantity. To that end, each client site establishes and may subsequently vary or reset a credit limit for each possible counterparty, which is used by the host computer to establish the gross counterparty credit limit for each possible pair of parties and which is equal to the minimum of the remaining credit (initial credit limit
 20 less any applicable transactions that have already been executed) from the first party to the second party and from the second party to the first party. The host computer blocks completion of an otherwise eligible matching transaction between a given pair of potential counterparties when the transaction has an associated value in excess of the applicable gross credit limit. In that system, the various client site computers (keystations) merely maintain and display a restricted subset of the information available at the central computer, such as a predetermined number of the best bids
 25 and offers, and communicate credit and other transaction oriented information to the host computer for execution. However, in an attempt to preserve the anonymity of the parties, the client sites do not have access to any credit limits set by their possible counterparties, or even to the identification of any other party to a particular transaction until after a transaction has been completed.

30 European patent application EP-A-0 512 702, which was published on 11.11.92 after the priority date of the present invention is considered as to its filed content, pursuant to Article 54(3) and (4) EPC, as comprised in the state of the art relevant to the present application in so far as the same Contracting States AT, BE, CH, DE, DK, ES, FR, GB, GR, IT, LI, LU, MC, NL, PT, SE are designated. This document discloses a simple filter in the receiving terminal which processes an incoming unmatched quote by replacing the identity of the originating party with a unilateral credit rating previously established for that originating party.

35 Thus, the known prior art trading systems do not provide an individual trader with any way to determine, prior to committing to buy or sell at a displayed price from one or more anonymous counterparties, whether he has credit with the anonymous counterparty offering (bidding) a particular price currently displayed on his screen and thus whether any attempt to buy or sell at the displayed price will be subsequently invalidated by the system for lack of such credit.

SUMMARY OF THE INVENTION

40 It is an overall objective of the present invention to provide an anonymous trading system which can identify the best bids and offers from those counterparties with which each client site is currently both willing and able to deal.

45 This object is solved by the features of the independent claim 1. Depending claims 2 to 16 are specifying advantageous developments thereof. To that end, each bid or offer for a particular type of financial instrument is prescreened by the system for bilateral credit with each potential counterparty, before calculating an anonymous "Dealable" price for presentation to any of the traders dealing with that particular financial instrument.

50 More particularly, in a presently preferred embodiment, the sensitive credit limit data indicating how much credit a particular client site is willing to extend to each possible counterparty is maintained only at an access node associated only with that particular client, and only a simple yes/no indication of whether the entity (for example, a trader, a trading floor, or a bank) associated with that particular access node is willing to transact business with a particular counterparty is transmitted to the other nodes of the communication network. In that preferred embodiment, the prescreening may thus be a simple check to determine whether any credit remains both from and to each of the two parties to the potential transaction which may be performed using a simple yes/no Preauthorization Matrix before any bid or offer is transmitted
 55 to a particular client site.

Such Preauthorization Matrices are preferably maintained at each of several regional nodes ("distribution nodes") of a distributed processing communication network, with each such distribution node being connected by corresponding individual permanent links of the network to those client sites ("access nodes") for which it is responsible for distributing

market information including customized "Dealable" bid and offer prices in addition to global "Best" prices. To further limit the data received and processed by each relevant regional node computer, (ie, the distribution node closest to the particular site and/or closest to the particular counterparty), only changes in the credit state between a particular access node and a particular counterparty (ie, credit is no longer available or credit is now available) are transmitted to the distribution nodes, and any credit state information only relevant to transactions between two client sites both associated with other distribution nodes, may be altogether ignored.

In a preferred embodiment of the system as currently contemplated, if either of the two applicable limits has not already been exceeded between a particular pair of counterparties, the system displays the entire bid or offer as a "Dealable" transaction, but permits each client site to block any above-limit portion of any resultant buy or sell transaction during a subsequent deal execution/verification process. Alternatively, possibly at the option of the party by or for whom the low limit has been set, the entire transaction could be executed, or the entire transaction could be blocked. As a second alternative, the Preauthorization Matrix could indicate whether sufficient credit remained to execute a predetermined "standard" deal amount in addition to, or instead of, a mere indication as to whether any credit from a particular potential counterparty had already been used up. In such an alternate embodiment it might also be possible to display to each trader two "Dealable" prices: one at which at least the predetermined "standard" amount is available, and a second price at which only a "Small" amount may be available.

As currently contemplated, each of the regional nodes transmits both a Best current price (for which a predetermined minimum quantity is available independent of any credit constraints) and a best Dealable price (for which at least limited credit is presumably available on a bilateral basis with at least one of the counterparties making the bid or offer), as well as a "Small" indicator that may indicate a thin potential market in which that predetermined minimum quantity is not available at any price from any counterparty with whom the trader is eligible to deal, but nevertheless a smaller quantity is available from one or more of such eligible counterparties. In determining whether such a predetermined minimum quantity is available, the system may consider composite deals from more than one Maker or at more than one price, in which case the displayed price is preferably the least advantageous price included in the best such composite deal. In an alternative embodiment, the system does not take into account such composite deals when displaying a price, but still identifies the oldest quote at the best price as a potential match, thereby giving the traders the benefit of any price advantages for smaller sizes.

In accordance with another aspect of the preferred embodiment, at least the first Maker having an open quote that is displayable as the "Best Dealable" or "Regular Dealable" at any of the other trading floors is automatically alerted that his bid (offer) quotation is the Best price available to at least one potential counterparty with whom mutual credit exists, and thus could be hit (taken) at any time. Similarly, at least if the quoter's bid (offer) quote is not currently the first Best quote at at least one trading floor and is thus subject to immediately being hit (taken) by a trader at that trading floor, he is preferably also alerted if his quote is "joined" (ie, equal to in price, but later in time) to such a "Best Dealable" or "Regular Dealable" price from another trading floor.

Preferably, in accordance with another aspect of the invention, the system also determines whether a Quote has been "bettered"; that is to say, no longer qualifies as a Dealable quote (or joined to such a quote) at at least one potential counterparty. In that case, at the trader's option, the system will automatically cancel such a bettered quote.

In accordance with yet another aspect of the invention, the displayed Dealable price (unless accompanied by the "Small" indicator) is valid for at least a predetermined minimum quantity (which, as noted previously, may be a composite of small sizes from more than one source, or which always reflects a regular size from only one source, depending on system design tradeoffs and/or the trader preferences) and only prices and not quantities are displayed. However, assuming that the Best Dealable price for a regular quantity is greater than the best Small price, each trader may optionally select which of the two such Dealable prices is displayed.

When a "buy" or "sell" is made for a quantity in excess of the cumulative applicable credit limits associated with the counterparties having open quotes equal to or better than the displayed price and thus the completed transaction is for a cumulative quantity smaller than desired by the trader, the trader preferably then has the option of "working the balance" (in which the system automatically generates a bid/offer for the difference).

In accordance with yet another aspect of the invention, changes in the Dealable price information and specifics of any subsequent transactions initiated by the trader are optionally vocalized electronically by the trader's terminal and provided to the trader in audible form, together with succinct details of any subsequent transactions. For example: Whenever there is a change in the Dealable "Buy" price, the least significant digits of that price are electronically converted to text which in turn is converted to digital speech using conventional speech synthesis circuitry.

The above description refers to the processing and distribution of data as though they were instantaneous processes; it will be appreciated by those skilled in the art that some delay is inherent in the type of system described, and that as a consequence, the information available at a particular processing node does not always reflect the most current information available anywhere in the system. However, at least in a preferred embodiment, any such delays in the display of Dealable price information may be kept within acceptable limits by transmitting only changes over the communication network, by using several processing nodes operating in parallel to compute the Dealable price infor-

mation for different trading floors and/or different currencies, and by providing dedicated communication links between each processing node and its associated trading floors.

BRIEF DESCRIPTION OF THE DRAWINGS

Other objects and features of the present invention will be apparent from the following description of a presently preferred embodiment taken in connection with the accompanying drawings, in which:

- Fig 1 is an overview of the Communication Network and the various workstations and processing nodes associated therewith;
- Fig 2 depicts the trader's Buy/Sell display;
- Fig 3 depicts the trader's Quote display;
- Fig 4 depicts the Trader Profile Display;
- Fig 5 shows the flow of messages in the communication network which are used to generate and distribute Dealable price information to each individual trader;
- Fig 6 depicts a Preauthorization Matrix; and
- Fig 7 is a functional flowchart showing how the Dealable price is computed.

DETAILED DESCRIPTION OF THE PREFERRED EMBODIMENT

In the described embodiment, the trading system is an electronic brokerage system having a communication network for facilitating the buying and selling of large blocks of foreign currency by traders each associated with his own Workstation ("WS") located at a trading floor of a subscriber bank ("client site"). As shown in Fig 1, each client site has its dedicated client site computer ("Market Access Node", or "MAN") under the control of a Floor Administrator, which maintains transaction records, credit limits, and other confidential information originating with its associated trading floor. The WS's and the MAN associated with each trading floor are connected via a conventional self-repairing DEC VAX network to a nearby distribution node ("Market Distributor" or "MD") computer, which typically analyzes and distributes current market data by means of dedicated permanent communication links to one or more associated MAN's in a particular city (or other local region), and which may also provide administrative functions for the communication network. Although not considered critical to the present invention, a group of MD's is preferably supplemented by a common trading region processing node ("Arbitrator Node" or "ARB"), with the ARB performing those functions (such as identifying potential matches between buyers and sellers, and other aspects of the "Deal Matching" process that require coordination with more than one client site) which make the most efficient use of the communication network if done centrally or regionally, while the MD's perform those functions (such as generation of separate Dealable price information for each individual client site) which are readily implemented in parallel in a distributed processing network and which make most efficient use of the communication network if done locally or in close proximity to the individual client sites.

In that regard, it is preferable to have more than one ARB, with each ARB having primary responsibility for trades initiated by Market Makers in the ARB's own trading region, and being connected to all the MAN's and MD's of that trading region as well as to the other ARB's in other trading regions by permanent dedicated links of the communication network. In the majority of deals, it is anticipated that both the Maker and the Taker will be within the same trading region and thus will be directly linked to the same ARB which can therefore identify a potential match and coordinate its final execution without any communication with the other ARB's; at the same time, the other ARB's can simultaneously be processing deals related to other traders in other regions. Connecting the various ARB's with one another by dedicated permanent communication links not only facilitates deals with a Taker in a remote trading region who does not normally have any direct link to the Maker's ARB, but also provides an efficient communication network for broadcasting price quotes to all the traders in other trading regions. Preferably, the various MD's, MAN's and ARB's are each provided with a local backup already connected to the communication network in accordance with the teachings of the commonly assigned US patent application entitled "ACTIVATION OF A DORMANT SIBLING COMPUTER IN A COMMUNICATION NETWORK" and filed 9 Nov 1990 under serial number 07/612,0451 (now US patent 5,289,578); however, it is also possible, albeit wasteful of communication resources, to establish temporary communication links between the MAN's and MD's of one trading area and an ARB in a remote trading area, so that the remote ARB can function as an emergency backup for the local ARB. In any event, the system is preferably provided with a self-test and re-initialization capability to detect discrepancies between the local data bases maintained at each of the local (MD) and regional (ARB) processing nodes, and to regenerate missing or questionable data from corresponding data stored at other nodes.

Whether the communication links between nodes are permanent (maintained indefinitely between two network components) or temporary (established dynamically for a short period of time) they are preferably "logical links" which

have the property that messages sent in a certain order over the same logical link are guaranteed to reach their destination in the same order. Moreover, the communication network is preferably provided with sufficient error detection, error correction, and network self-repair capability to guarantee that messages sent via these logical links are error free.

In summary, each MAN is connected to other MAN's by a robust communication network which connects the various trading floors and which supplements the MAN's with a number of processing nodes (preferably in the form of MD's and ARB's) to facilitate the distribution of price quotations and other market data and to execute transactions by matching eligible Market Makers with eligible buyers and sellers and by monitoring the transactions until they have been completed or aborted, with the MAN's being responsible for trading floor specific tasks such as logging the completed transaction and updating the credit limit that was previously available to the counterparty trading floor.

The structure and function of the trader WS's, MAN's, MD's, and ARB's will now be described in detail, with particular emphasis on how they cooperate to distribute price quotes (bids and offers) from a Market Maker to potential Takers throughout the system. In the prior art, such quotes were made available to the individual traders merely in the form of one or more public best prices for each currency pair (or other financial instrument type) then being offered by any Market Maker, without regard for any confidential credit restrictions imposed by the Maker or by the potential Taker that may prevent any deal being consummated. However, in accordance with the present invention, each trader receives a private Dealable price, which the system has prescreened for the absence of any credit restrictions that would prevent the trader on whose WS the Dealable price is displayed from dealing with an anonymous Market Maker from whom the displayed price originates.

As shown in Figs 2 through 4, each WS supports a single trader trading in a single currency pair, and its display thus provides one or two panels containing only information which a typical trader would consider essential to trading in that currency pair by means of an anonymous brokerage system. However, the blank portion of the WS display could obviously be used for other data related to another currency pair and/or another type of transaction. Furthermore, the displayed panel could be a window within a larger display that also displays data from other information distribution and transaction processing systems.

Fig 2 shows the trader's Buy/Sell display panel 10 which provides the primary interface between the electronic brokerage system and the individual traders. At the top of the display appears the currency pair 12 (as shown, the "Base Currency" is United States dollars, "Local Currency" is German marks), and at the top right, the "Value Date" 14 (the date on which any resultant trade is scheduled for payment). The next line comprises (from left to right): the "Figure" (the most significant three or four digits) 16 of the "Sell" ("bid") price, conventionally expressed in units of Local Currency (eg, DM 1.72) per single unit of Base Currency (eg, US\$1.00); two additional digits 18,20 (commonly referred to as "Pips") which respectively reflect the remaining two or three least significant digits of the displayed "Best" bid and offer prices (ie, the best price at which at least one anonymous Market Maker is willing to buy the Local Currency, and the best price at which at least one anonymous Market Maker is willing to sell the Local Currency); and the "Figure" 22 of the "Best" offer price.

A Market Maker will always want to purchase a commodity at a lower price than the price at which he is willing to sell the same commodity and his bid price will thus be less than his offer price. Moreover, the trading system is preferably able to "automatch" a bid price from one Maker with an equal or lower offer price from another Maker, assuming that the two Makers have sufficient credit with each other. Accordingly, the displayed "Best price" 18,20 will normally reflect a price spread in which the offer price is equal to or higher than the bid price; however at times it may reflect an "Arbitrage Opportunity" in which a third party having credit with the two Makers is able to buy at a lower offer price from one Maker and sell at a higher bid price to the other Maker.

Furthermore, there is no requirement that a Market Maker must always quote both a bid price and an offer price for the same quantity of the Local Currency, or that if a bid (or offer) price is accepted by a seller (or buyer), any corresponding offer (or bid) price from that Maker will be (preferably at the trader's option) automatically withdrawn. Thus it is also possible that an offer price but no bid price (or vice versa) will be displayed as the Best price 18,20 at the top of the display.

As presently contemplated, the displayed Best bid and offer prices 18,20 are each valid for at least a predetermined quantity of currency (for example five million US dollars) from a single source. Since such a quantity may be available at the displayed price in a composite transaction involving more than one Maker and more than one price, it is possible that at least a portion of the transaction could be executed at a better price than the displayed Best price 18,20.

In accordance with the invention, a "Dealable" bid and/or offer price is derived only from those bids or offers from other trading floors which have been prescreened for at least some nominal level of remaining credit from the potential Maker to the potential Taker and vice versa, and at least the "Pips" 24,26 portion of the Dealable price is prominently displayed or otherwise communicated to the potential Taker.

In the illustrated example, the associated Taker (and any other USD/DEM traders on his trading floor) is thus eligible to sell German marks ("DEM") at the bid rate of 1.7210 marks per dollar ("USD"), or to buy at the offer rate of 1.7217 marks per dollar, and the system has already verified that the displayed Dealable price 24,26 is currently available from one or more anonymous Makers with whom the trader is currently still eligible to deal, and that those eligible

Makers are willing (either collectively or individually, depending on the trader preferences and/or design tradeoffs mentioned previously) to sell (or buy) at least the same predetermined minimum quantity of the particular Local Currency involved as was used to determine the displayed Best price 18,20. Thus, a "regular" displayed Dealable price 24,26 will never be better than the displayed Best price 18,20; if worse than the Best price 18,20, this is an indication that the trader is barred by credit limitations from obtaining the best price that is then theoretically available. Indeed, because credit is established bilaterally, it is possible that the Maker (or Makers) behind the Best price have extended credit only to trading floors who currently have not extended any credit to those particular Makers, and thus that none of the traders at any of the client sites will see a Dealable price equal to the displayed Best price.

The foregoing implicitly assumes that the Best price 18, 20 and the Dealable price 24,26 are sufficiently close that the Figures 16, 22 are unaffected. If that is not the case, it is preferable that the displayed Figures correspond to the corresponding most significant digits of the displayed Dealable prices; if the "Pips" of the Best price are worse than the corresponding least significant digits of a displayed Dealable price, it will be apparent that the corresponding Figure of the Dealable price should be incremented or decremented by at least one digit to obtain the Best price.

Moreover, as with the Best price, it is possible that at least a small quantity is available from one or more Makers at a better price than that which is currently displayed as a regular Dealable price (or even that a better price becomes available after the price is displayed but before the Taker's Buy or Sell request is processed), in which case the trader may receive or pay an effective average price that is somewhat better than the currently displayed Dealable price. This will be the case whether the system has executed a single transaction only with a second Maker with whom the better price originated, or a composite transaction with that second Maker and the Maker with whom the displayed price originated.

Instead of a regular Dealable price, a Small price may be displayed, preferably identified as such (for example, by the letter "S") 28 and which differs from the regular Dealable price in that only a relatively small quantity is collectively available at any price from those Makers with whom the trader currently is eligible to deal. For example, if deal size is expressed in units of one million dollars, the Best price and the regular Dealable price may each represent available deals having a potential aggregate value (not necessarily all from the same trader) of at least 5 million dollars, while a Small price represents available deals having a maximum potential value of between 1 and 4 million dollars.

Among the options available to each trader through his Trader Profile panel (see Fig 4) is the ability to display either the regular Dealable price as described above, which is good for at least the previously mentioned predetermined minimum quantity (eg, at least 5 million dollars), or a best Dealable price which is the best price available to that trader for even a nominal minimum quantity (eg, only 1 million dollars).

Preferably, the trader has also previously specified a default transaction quantity using his Trader Profile Screen and the displayed Dealable price functions as the default value for the trader's requested transaction price. Thus, the trader may quickly and accurately respond to a new Dealable bid or offer price by merely activating a Buy button 34 or a Sell button 36, respectively on the screen, assuming that the display is touch sensitive or is provided with a "mouse" or other pointing device; alternatively the Trader may use a small custom keypad having dedicated function keys for the various functions and dedicated size keys for various predetermined deal sizes as well as conventional numerical, tab and cursor keys. If the desired quantity 30, 32 is not available at the displayed Dealable price, as will be discussed in more detail with respect to Figs 3 and 4, any missed quantity may be the subject of a subsequent "working the balance" bid or offer.

In any event, the system gives the trader accepting a Dealable price the benefit of any undisplayed Small price from an eligible counterparty that is "behind" (ie, equal to or better than) the Dealable price. In that case, the buy or sell request would be executed as two trades, one at the undisplayed Small price, and the other at the displayed Dealable price.

As noted previously, the trading is performed electronically, and when a bid price is equal to or greater than an offer price, the two will normally be automatically matched, with the system automatically allocating any price difference between the two traders in accordance with previously agreed trading rules. Thus it is not likely that a displayed bid price 18,24 will be greater than a displayed offer price 20,26. However, if two traders are barred from dealing with each other because of credit limit restrictions but are both free to deal with a third trader, it is still possible that the third trader will be presented with an arbitrage opportunity.

When the Dealable price 24,26 originates with the trader himself (or another trader on the same floor), the trader is preferably alerted to that fact by displaying his price as the Dealable price, but in a visually distinctive manner and with the corresponding Buy or Sell function 34, 36 optionally inhibited. Thus, his trading floor may be prevented from in effect dealing with or against itself.

In accordance with another aspect of the invention, the displayed price data may optionally be "vocalized": whenever there is a change in the displayed prices, the numerical data is electronically converted to text which in turn is converted to digital speech using conventional speech synthesis circuitry. In that event, it is preferable that only the "Pips" of the "Dealable" price quotes are announced (unless, due to a large spread, this would result in an ambiguous price), so that the trader will not be assaulted with nonessential information. Thus, the vocalized information will normally

EP 0 625 275 B1

include only the least significant digits (Pips) of the displayed Dealt bid and offer prices, as well as status changes for any recent quotes or hits initiated by the trader. An exemplary trading scenario and the resultant vocalized communications is presented in Table 1.

Fig 3 shows how the display is transformed when the trader is not content to assume a passive role in which he

merely reacts to deals solicited by other traders, but rather wishes to assume for himself the role of a Market Maker. In that case, a Maker's "Quote" panel 40 appears below the Taker's "Buy/Sell" panel 10 of Fig 2, so that the trader may act both as a Maker and as a Taker, using a pointing device or a designated key of an alphanumeric keyboard to move between the two panels. The Figures 42, 44 and Pips 46, 48 have the same function as in the Taker's panel, and take their respective initial values from the current Best price. As in Fig 2, the bid information is on the left, while the offer information is on the right. Immediately below the price information, the trader is presented with the relevant bid and offer quantities 49,50, conventionally expressed in millions of US dollars. When the Maker's panel first appears, these quantities assume default values (10,10) established by the trader's personal trading profile. The trader is able to change any "Pips" or "quantity" amount shown on the Maker's panel by means of a numerical keyboard, using the enter key to move from field to field. Alternately, changes in the numerical data could be entered by selecting the field with a mouse or other pointing device, with a single click indicating an upward increment of one Pip and a double click indicating a downward increment of one Pip. Once the trader has changed the displayed numerical information to his satisfaction, he may then send a double sided bid/offer quote message (QuoteSubmit, Fig 5) either by activating Send button 52 with a mouse or a conventional tab key and enter key, or by using a dedicated Send key on the trader's keyboard (not shown). Optionally, the trader may also send a single-sided bid or offer, using the Bid button 54 or Offer button 56 instead of the Send button 52. Once the quote has been transmitted, an optional timer (not shown) may provide a visible and/or audible indication that a predetermined exposure time has elapsed. In addition, the trader may specify in his Trader Profile panel (Fig 4) an optional automatic quote interrupt, whereby the quote is withdrawn once a predetermined maximum exposure time has been reached. At any time, the trader may use the Off button 60 to withdraw his current quote, whereupon he may compose and send a new quote.

Preferably, as will be discussed in additional detail with respect to Fig 7, at the same time the system uses the quote and any associated credit prescreening information to determine the dealable prices to be displayed at each potential counterparty, the system also determines whether the current quote is equal to the Dealable price (either Best Dealable or Regular Dealable) available to any potential counterparty with whom bilateral credit currently exists, and if so, alerts the quoter that the displayed price has priority in time over any other available quote for that deal size (regular or small) from other trading floors and is subject to immediately being hit/taken (a "Red Dealable" quote, preferably indicated by red background) or is equal to such a Red Dealable (regular or small) quote from another trading floor (a "Joined" quote, preferably indicated by a = sign and a yellow background).

As shown in Fig 4, each trader can call up a "Trader Profile" screen 70 to select his current trading currency 72, and also to establish or modify his personal default values for normal and maximum trading size 74, 76 and price time limit 78, and his preferences regarding optional automated trading protocols 78, such as canceling a quoted price that has been partially dealt (only a portion of the available size was matched with a qualified counterparty) or bettered (is not equal to the Best Dealable price for that size that is currently available to any potential counterparty with whom bilateral credit still exists). As noted previously, the trader may also elect to display the Regular 80 or Best 82 Dealable price, and the system also provides the trader with various options 82 for automatically "working the balance" in the event the trader attempts to buy or sell a particular quantity at the displayed Dealable price but misses the deal in whole ("complete") or in part ("partial"). Depending upon the particular option selected, the system automatically generates and transmits a bid at the last Dealable offer price if the trader was not able to buy the full quantity desired, for a quantity equal to the difference between the desired quantity and the quantity actually traded.

In addition, a Floor Administrator (preferably for internal security reasons a bank employee free of any trading responsibilities) has his own WS with a Floor Profile screen (not shown) which includes an option to prevent his own traders from trading with each other, and a maximum Business Day Credit Limit for each eligible counterparty which represents the maximum cumulative value of trades that may be executed by all traders of the trading floor with the designated counterparty. Alternately, the system could combine transactions from related trading floors, in which case the Floor Profile could merely identify a common credit facility having a single credit limit for each trading floor or groups of trading floors. The Floor Administrator also selects a warning percentage which the system uses to broadcast a warning message to the Administrator and all the traders on a given floor that a particular counterparty has utilized a specified percentage of its available credit, in which case the traders may wish to alter their trading strategies and/or the Floor Administrator may choose to raise the applicable credit limit.

Fig 5 shows the flow of electronic messages relating to the distribution of customized Dealable price information to each trading floor. The trader at WS A1a1 of trading floor A1a uses his Price Quotation (Market Maker) Panel (Fig 3) to generate a QuoteSubmit message to the trading floor's MAN (MAN A1a) in the form of a bid to buy at 1.7215 and an offer to sell at 1.7216. The MAN in turn logs the QuoteSubmit as two open quotations (one, if a single-sided quote) and forwards the QuoteSubmit message to the Maker's Arbitrator Node (ARB A) whose assigned geographical trading region includes the Maker's trading floor A1a1. In turn, ARB A updates an ordered list of available bids and an ordered list of available offers for the relevant currency pair, each ranked by price and time of receipt (preferably at the Maker's ARB), and containing data fields for indicating the Quantity (preferably expressed in Base Currency units) of the Local Currency still available for purchase or sale, and the Quantity reserved by the Arbitrator pending completion or failure

of a pending deal resulting from a potential match initiated by the arbitrator and not yet confirmed by the Maker and Taker. A corresponding QuoteAvailable message is then transmitted from the Maker's ARB A to the MD's in its trading region MD A1, MD A2, and to the other ARB's for eventual distribution to the MD's and MAN's of other trading regions.

Each MAN (for example, MAN A1b) also transmits a CreditUpdate message to its associated ARB (ARB A) whenever the credit status for any of its potential counterparties (for example, A1a or A2a) changes from CreditAvailable to CreditNotAvailable or vice versa, which the ARB then retransmits to its affected MD's and to the other affected ARB's.

The MD's then use the information in the received CreditUpdate messages to maintain a Preauthorization Matrix PM such as that shown in Fig 6. The rows and columns of the matrix PM are associated with the various trading floors A1a, A1b, A2a, etc (including any floors in other trading regions) and for each ordered pair of trading floors $\{TF_i, TF_j\}$ contains an indication as to whether TF_j has extended any credit to TF_i . In the depicted example, credit exists on a bilateral basis between TFA1 and TFA2, no credit exists between TFA1 and TFB1, and credit has been extended unilaterally from TFA2 to TFB1, but not vice versa (as indicated by the "1" at the intersection of row TFB1 with column TFA2 and the "0" at the corresponding intersection of column TFB1 with row TFA2). From the main diagonal of the matrix it can be seen that only TFA2 permits its own traders to trade between themselves, as indicated by the "1" at the intersection of row TFA2 with column TFA2. Preferably, each MD only maintains a partial Preauthorization Matrix containing data only regarding credit extended from or to its associated MAN's to the other potential counterparties (MAN's) in the system. Thus, as indicated in Fig 6 by cross hatching, some of the matrix entries may be blank.

The MD's use the QuoteAvailable messages to update their own ordered lists of available bids and offers; these ordered lists and the above-described Preauthorization Matrix are then used by the MD to calculate separate Dealable prices for each trading floor which are transmitted as MarketView messages to the affected MAN's, as will be described in more detail hereinafter with reference to Fig 7. In addition, the MD's and/or ARB's use a similar procedure to identify which quotes from which trading floors are "Red Dealable" or "Joined" or "Bettered": A quote is "Red Dealable" only if it is the basis (best in price and time of the bids or offers originating from trading floors with which bilateral credit is still available) for a "Dealable" price displayed at one or more trading floors; once the "Red Dealable" quotes have been identified, the other quotes may be readily categorized as either "Joined" (if not first in time) or "Bettered" (if not best in price).

The actual deal is executed using a known two-stage commitment logging process (not shown) in which DealVerify and DealVerifyOk messages are logged by and transmitted from the Maker's MAN to the Taker's MAN and vice versa, after each MAN has verified that the other party to the deal has been extended sufficient credit by the Man's associated trading floor to cover the full deal quantity (otherwise the deal is aborted or is cut back in quantity). As an additional precaution, the Maker's MAN also checks that the quote has not been interrupted and that the WS from which the quote originated is still on-line, before any DealVerify or DealVerifyOk message is transmitted to the other trading floor (equivalently, each WS involved could perform its own logging and communicate directly with the other WS; however, this would complicate any subsequent automated deal recovery or rollback). A suitable logging, verification, and recovery/rollback process is disclosed in further detail in the commonly assigned US patent application filed on 2 November 1990 under serial number 07/608,643 (now US patent 5,305,200) and entitled "FINANCIAL EXCHANGE SYSTEM HAVING AUTOMATED RECOVERY/ROLLBACK OF UNACKNOWLEDGED ORDERS". In any event, it should be understood that each ARB also maintains a log of potential matches which have not yet been verified or canceled by the affected MAN's, and that if these potential matches are not resolved within a predetermined time period, a similar automated rollback/recovery process can update the ARB's log on the basis of the logs maintained by the affected MAN's (for example, the match may be automatically canceled (rolled back) if either MAN does not have a corresponding entry in its respective log).

Fig 7 sets forth a possible implementation of how the MD computes a Dealable bid for a particular currency currently available to a particular trading floor, which may then be transmitted in the form of a MarketView message to that trading floor. Preferably, in order to avoid the transmission of redundant information and consequent excessive loading of the communication network, these MarketView messages are transmitted to a particular MAN only in response to a change in the Dealable price for the associated trading floor. Moreover, it may be more efficient to transmit information only for those active currency pairs which the trading floor's MAN has previously identified to its MD in an ActiveCurrencyPair message.

As indicated symbolically in Fig 7 at block 100, the MD first selects the particular trading floor and currency pair for which the Dealable bid and offer price is to be computed (Fig 7 shows only the computation of the Dealable bid price; a similar computation is then performed for the Dealable offer price before a new trading floor and/or currency is selected). The MD then resets (block 102) the counters, registers and flags (i, P, Q, S) it will use in the computation of the Dealable price P.

What follows is a loop controlled by counter i, which points to the entries in the particular ordered Quote List associated with the currency pair and transaction type (bid or offer) then being processed, and which is incremented at the beginning of the loop (block 104). If the end of the Quote List has already been reached (Yes branch from decision block 106), the current values of the price P and the associated Small flag S are transmitted to the trading floor TF,

together with an indication of the current currency pair CP (as previously noted, no such transmission is required if the price and Small flag for that currency pair to that trading floor are unchanged). However, if the end of the Quote List has not already been reached (No branch from decision block 106) the next quote is then read (block 110) and the relevant entries in the Preauthorization Matrix for the current trading floor (TF) and the Maker of the current quote (M_i) are then checked to determine if any previously extended credit has already been exhausted (decision blocks 112, 114). If either entry is "0" (indicating no credit available) control passes to the beginning of the loop (block 104), for processing of any remaining quotes in the applicable list.

However, if both relevant entries of the Preauthorization Matrix are "1" (indicating at least some credit is available on a bilateral basis between the current trading floor TF and the Maker M_i from which the current quote Q_i originated), the price P_i associated with quote Q_i is loaded into the price register P, and the associated Available Quantity Q_i is added to the contents of the Quantity register Q (block 116), which is then tested (decision block 118) to determine if at least a predetermined minimum quantity (eg, 5) is available to the current trading floor TF; otherwise control passes to the beginning of the loop (block 102) and the process is repeated.

Assuming that the predetermined minimum quantity is available (Yes branch from block 118), the Small flag is reset to 0, and control passes to block 108, whereby the Dealable price is transmitted and the process is repeated.

It will be understood that the above assumes that a regular dealable price may be based on a potential composite deal which is based only on quotes for a small size of the currency in question and that a small dealable price is to be displayed only if such a regular dealable price is not available from any qualified counterparty or combination of qualified counterparties; if as mentioned previously it is desired to display only regular dealable prices from a single source and/or to give each trader the option of displaying either the Best Dealable price or the Regular Dealable price, then it may be necessary to scan the available quotes twice (once for the best available regular sized quote, once for the best available quote regardless of size) and/or to maintain separate registers for Best and Regular sized prices.

By using more than one MD each in the form of a dedicated computer, the computation of Dealable prices is distributed among several computers and is free from interruption by other unrelated tasks. Moreover, only a minimum amount of essential information is transmitted to the MD from its ARB, and from the MD to its MAN's. Thus even in a fast moving market, it should be possible to provide current Dealable price information to each trading floor. However, if an MD is responsible for distributing Dealable prices to more than two trading floors, it may be preferable to use a conventional pseudorandom generator to select the next trading floor, thus avoiding any bias inherent in the sequence in which the Dealable price information is computed and distributed.

As mentioned previously, the MD could, at the same time it reviews the ordered list of available quotes, also identify any quote which qualifies as "Red Dealable" or "Joined" and transmit a corresponding HitAlert message to the Maker's MAN (possibly via the Taker's ARB and the Maker's ARB). Alternatively, each ARB could repeat the process of Fig 7 for each trading floor in the entire trading system, which would require more computational resources but fewer communication resources. In particular, such an alternate embodiment, as shown in Fig 5, would require at most only one HitAlert message for each bid or offer (to the Maker's MAN from the Maker's own ARB).

Claims

1. A computerized trading system for trading of financial instruments between traders trading at a plurality of trading floors, said system comprising

a communication network for transmitting electronic messages,
a plurality of trader terminals (WS) each associated with a respective one of said trading floors (MAN) and connected to the communication network, for

generating electronic price quotation messages (QuoteSubmit) including bid and/or offer prices (46,48), and

communicating selected bid and offer price information (24,26, 18,20) based on price quotation messages (QuoteSubmit, QuoteAvailable, MarketView) originating from other said trading floors and received over the communication network,

credit limit administration processing means (MAN, ARB) connected to the communication network, for automatically determining whether a predetermined level of credit is currently respectively available (CreditUpdate) from each trading floor to each of the other trading floors, and
dealable price distribution processing means (MD) connected to said communication network and responsive to said price quotation messages (QuoteAvailable) as well as to said credit limit administration processing means (MAN, ARB) for automatically transmitting dealable price messages (MarketView) to the terminals (WS

A1b1, WS A1b2) of at least one particular trading floor (MAN A1b), said dealable price messages (MarketView) being derived only from price quotation messages (QuoteSubmit) from those trading floors (MAN A1a) for which said credit limit administration processing means (ARB A, MAN A1a, MAN A1b) has determined that said predetermined level of credit is currently available on a bilateral basis both from and to said particular trading floor (MAN A1b).

2. The trading system of claim 1, wherein said selected price information communicated by the terminal at said particular trading floor comprises dealable price information (24, 26) derived from said dealable price messages (MarketView).

3. The trading system of claim 2, wherein said dealable price information (24,26) comprises the best price for a predetermined quantity (\$5m) available from any of said trading floors (MAN) with which bilateral credit currently exists.

4. The trading system of claim 3, wherein said dealable price information (24,26) is the best price for said predetermined quantity (\$5m) available as a single quote from a single one of said trading floors (MAN) with which bilateral credit currently exists.

5. The trading system of claim 3, wherein said dealable price information (24,26) is determined from the best prices for said predetermined quantity (\$5m) available on a composite price based on a plurality of quotes from one or more of said trading floors (MAN) with which bilateral credit currently exists.

6. The trading system of claim 3, wherein said dealable price information further comprises the best price (24,26) for any quantity (28) available from at least one of said trading floors with which bilateral credit currently exists.

7. The trading system of claim 6, wherein

trades are possible for a small quantity (28) less than said predetermined quantity, and said terminal (WS) displays a price (24,26) applicable only to a small, but otherwise dealable, quantity (28) when said predetermined quantity is not available to the associated trading floor.

8. The trading system of claim 1, wherein said dealable price information is communicated in the form of a visible display.

9. The trading system of claim 1, wherein said dealable price information is communicated to at least one of the traders in the form of vocalized text.

10. The trading system of claim 1, further comprising

a plurality of access nodes (MAN) connected to the communication network, including a first access node (MAN A1a) associated only with a first trading floor and a second access node (MAN A2a) associated only with a second trading floor, for maintaining a record of all trades executed on behalf of an associated trading floor, and one or more distribution nodes (MD) connected to the communication network,

wherein

said access nodes (MAN) collectively comprise said credit limit administration processing means, said distribution nodes (MD) collectively comprise said dealable price distribution processing means, said access nodes transmit over the communication network to said distribution nodes credit update messages (CreditUpdate) which indicate whether said predetermined level of credit is currently available from one trading floor to another trading floor without indicating the extent of any credit currently remaining above said predetermined level, said dealable price distribution processing means maintains at each of said distribution nodes an ordered list (110) of at least those of said price quotation messages (QuoteSubmit) which are not yet withdrawn or reserved and a preauthorization matrix (PM) whose individual entries collectively indicate whether or not said predetermined level of credit is available on a bilateral basis between each of its respective trading floors and each of said plurality of trading floors,

said dealable price information (108) is transmitted from each said distribution node to one or more of said access nodes for eventual transmission to associated ones of said terminals (WS),
 each said access node (MAN) is located on the premises of a respective trading floor (TF) and contains only credit information originating with said respective trading floor,
 said credit limit administration processing means transmits an electronic credit update message (CreditUpdate) to said distribution nodes (MD) whenever a predetermined minimum level of credit becomes available or is no longer available to a particular said trading floor, and
 said credit update message does not specify the amount of credit available.

11. The trading system of claim 10, wherein those quotes which are for a price not worse than a particular said dealable price and which originate from a trading floor which has bilateral credit available with the trading floor associated with said particular dealable price are identified as "deable quotes".

12. The trading system of claim 11, wherein the record of executed trades maintained by each access node is used to automatically recover or rollback pending transactions which have been identified by another node as potential trades but which have not yet been fully executed or canceled.

13. The trading system of claim 10, wherein

said price quotation message (QuoteSubmit) includes designation of the trading floor (TF) from which the quotation originates,
 said trading floor designation (TF) is used by said each distribution node (MD) in deriving said dealable price messages (MarketView), and
 said dealable price message does not include any designation of the trader or trading floor from which the quotation originates, when received by any said market access node (MAN) or trader terminal (WS).

14. The trading system of claim 10, wherein said current credit limit is derived from a predetermined maximum trade volume and the actual cumulative trade volume between said associated trading floor and one other trading floor dealing in a plurality of types of financial instruments.

15. The trading system of claim 14, wherein said current credit limit is a combined limit applicable to a plurality of related trading floors.

16. The trading system of claim 1, wherein said dealable price distribution processing means is responsive to unilateral credit update messages received over the communications network from the individual trading floors.

Patentansprüche

1. Computerisiertes Handelssystem für den Handel mit Finanzinstrumenten zwischen an verschiedenen Börsenplätzen tätigen Händlern, mit

einem Kommunikationsnetzwerk zum Übertragen von elektronischen Mitteilungen,
 einer Mehrzahl von Händlerterminals (WS), die jeweils einem der Börsenplätze (MAN) zugeordnet und mit dem Kommunikationsnetzwerk verbunden sind, um

elektronische Kursmitteilungen (QuoteSubmit) einschließlich Biet- und/oder Angebotspreisen (46, 48) zu erzeugen, und um
 ausgewählte Biet- und Angebotspreisinformationen (24, 26, 18, 20) auf Basis von von anderen Börsenplätzen stammenden und über das Kommunikationsnetzwerk empfangenen Kursmitteilungen (QuoteSubmit, QuoteAvailable, MarketView) mitzuteilen,

einer mit dem Kommunikationsnetzwerk verbundenen Einrichtung zum Verwalten von Kreditlimits (MAN, ARB) zum automatischen Bestimmen, ob ein bestimmter Kreditrahmen zwischen jeweils jedem der Börsenplätze zu jedem anderen Börsenplatz gegenwärtig verfügbar ist (CreditUpdate), und mit
 einer mit dem Kommunikationsnetzwerk verbundenen Einrichtung (MD) zum Verteilen der handelbaren Kurse, die von den Kursmitteilungen (QuoteAvailable), sowie von der Einrichtung zum Verwalten von Kreditlimits (MAN, ARB) abhängt, um automatische Mitteilungen über handelbare Kurse (MarketView) zu den Terminals

(WSA1b1, WSA1b2) von mindestens einem bestimmten Börsenplatz (MAN A1b) zu übertragen, wobei die Mitteilungen über handelbare Kurse (MarketView) nur aufgrund von Kursmitteilungen (QuoteSubmit) von solchen Börsenplätzen (MANA1a) erhalten werden, für die die Einrichtung zum Verwalten von Kreditlimits (ARBA, MANA1a, MANA1b) bestimmt hat, daß der vorbestimmte Kreditrahmen gegenwärtig auf gegenseitiger Basis sowohl von als auch zu dem bestimmten Börsenplatz (MAN A1b) verfügbar ist.

2. Handelssystem nach Anspruch 1, **dadurch gekennzeichnet**, daß die an dem bestimmten Börsenplatz durch das Terminal mitgeteilte ausgewählte Kursinformation eine Information über einen handelbaren Kurs (24, 26) umfaßt, die aufgrund der Mitteilungen über handelbare Kurse (MarketView) bestimmt worden ist.

3. Handelssystem nach Anspruch 2, **dadurch gekennzeichnet**, daß die Information über einen handelbaren Kurs (24, 26) den besten Kurs für eine bestimmte Menge (\$5m) umfaßt, der von jedem der Börsenplätze (MAN) erhältlich ist, mit denen gegenwärtig ein gegenseitiger Kredit besteht.

4. Handelssystem nach Anspruch 3, **dadurch gekennzeichnet**, daß die Information über einen handelbaren Kurs (24, 26) der beste Kurs für die vorbestimmte Menge (\$5m) ist, der als einzelne Quote von einem einzelnen der Börsenplätze (MAN) erhältlich ist, mit denen gegenwärtig ein gegenseitiger Kredit besteht.

5. Handelssystem nach Anspruch 3, **dadurch gekennzeichnet**, daß die Information über einen handelbaren Kurs (24, 26) aus den besten Kursen für die vorbestimmte Menge (\$5m) bestimmt wird, die aufgrund eines zusammengesetzten Kurses auf der Grundlage einer Mehrzahl von Quoten von einem oder mehreren der Börsenplätze (MAN) erhältlich sind, mit denen gegenwärtig ein gegenseitiger Kredit besteht.

6. Handelssystem nach Anspruch 3, **dadurch gekennzeichnet**, daß die Information über einen handelbaren Kurs den besten Kurs (24, 26) für eine beliebige Menge (28) umfaßt, der von mindestens einem der Börsenplätze erhältlich ist, mit denen gegenwärtig ein gegenseitiger Kredit existiert.

7. Handelssystem nach Anspruch 6, **dadurch gekennzeichnet**, daß

Handel für eine kleine Menge (28) möglich ist, die geringer als die vorbestimmte Menge ist, und daß das Terminal (WS) einen zu einer kleinen aber ansonsten handelbaren Menge (28) gehörigen Kurs (24, 26) anzeigt, wenn die vorbestimmte Menge an dem zugeordneten Börsenplatz nicht verfügbar ist.

8. Handelssystem nach Anspruch 1, **dadurch gekennzeichnet**, daß die Information über einen handelbaren Kurs über eine Sichtanzeige mitteilbar ist.

9. Handelssystem nach Anspruch 1, **dadurch gekennzeichnet**, daß die Information über einen handelbaren Kurs an mindestens einen der Händler in Form eines gesprochenen Textes mitteilbar ist.

10. Handelssystem nach Anspruch 1, **gekennzeichnet durch**

eine Mehrzahl von mit dem Kommunikationsnetzwerk verbundenen Zugangsknoten (MAN), einschließlich einem nur mit einem ersten Börsenplatz verbundenen ersten Zugangsknoten (MAN A1a) und einem nur mit einem zweiten Börsenplatz verbundenen zweiten Zugangsknoten (MAN A2a) zum Erhalten einer Aufzeichnung von allen im Namen eines assoziierten Börsenplatzes durchgeführten Handels-Geschäfte, und durch einen oder mehrere mit dem Kommunikationsnetzwerk verbundene Verteilungsknoten (MD),

wobei

die Zugangsknoten (MAN) gemeinsam die Einrichtung zum Verwalten von Kreditlimits aufweisen, die Verteilungsknoten (MD) gemeinsam die Einrichtung zum Verteilen der handelbaren Kurse aufweisen, die Zugangsknoten über das Kommunikationsnetzwerk Kredit-Aktualisierungsmitteilungen (CreditUpdate) an die Verteilungsknoten übertragen, die angeben, ob der vorbestimmte Kreditrahmen gegenwärtig von einem Börsenplatz zu einem anderen Börsenplatz verfügbar ist, ohne daß der Betrag eines gegenwärtig über dem bestimmten Rahmen verbleibenden Kredits angezeigt wird, die Einrichtung zum Verteilen der handelbaren Kurse an jedem Verteilungsknoten eine Orderliste (110) von mindestens denjenigen Kursmitteilungen (QuoteSubmit) aufrechterhält, die noch nicht zurückgewiesen oder reserviert worden sind, sowie eine Vorauthorisierungsmatrix (PM), deren einzelne Einträge gemeinsam an-

zeigen, ob der vorbestimmte Kreditrahmen auf einer gegenseitigen Basis zwischen jedem der jeweiligen Börsenplätze und jedem der Mehrzahl der Börsenplätze verfügbar ist,

die Information über den handelbaren Kurs (108) von jedem der Verteilungsknoten zu einem oder mehreren der Zugangsknoten übertragen wird, um schließlich zu einem der assoziierten Terminals (WS) übertragen zu werden,

jeder der Zugangsknoten (MAN) auf dem Gelände eines jeweiligen Börsenplatzes (TF) eingerichtet ist und nur Kreditinformation enthält, die von dem jeweiligen Börsenplatz stammt.

die Einrichtung zum Verwalten von Kreditlimits eine elektronische Kredit-Aktualisierungsmitteilung (CreditUpdate) an die Verteilungsknoten (MD) überträgt, wann immer ein bestimmter minimaler Kreditrahmen zu einem bestimmten Börsenplatz verfügbar oder nicht mehr länger verfügbar ist, und wobei die Kredit-Aktualisierungsmitteilung nicht den Betrag des zur Verfügung stehenden Kredits angibt.

11. Handelssystem nach Anspruch 10, **dadurch gekennzeichnet**, daß die Quoten, die für einen Kurs nicht schlechter als ein bestimmter handelbarer Kurs stehen und die von einem Börsenplatz stammen, der einen gegenseitigen Kredit mit dem mit dem bestimmten handelbaren Kurs assoziierten Börsenplatz verfügbar hat, als "handelbare Quoten" gekennzeichnet werden.

12. Handelssystem nach Anspruch 11, **dadurch gekennzeichnet**, daß die durch jeden Zugangsknoten geführte Aufzeichnung von ausgeführten Handels-Geschäften dazu verwendet wird, automatisch schwebende Transaktionen rückzuführen oder rückabzuwickeln, die von einem anderen Knoten als potentielle Geschäfte identifiziert, aber noch nicht vollständig ausgeführt oder abgelehnt worden sind.

13. Handelssystem nach Anspruch 10, **dadurch gekennzeichnet**, daß

die Kursmitteilung (QuoteSumit) den Börsenplatz (TF) angibt, von dem die Mitteilung stammt, die Börsenplatzherkunft (TF) durch jeden Verteilungsknoten (MD) dazu verwendet wird, die Mitteilungen über die handelbaren Kurse (MarketView) zu erhalten, und daß die Mitteilung über handelbare Kurse keinen Hinweis auf die Herkunft des Händlers oder des Börsenplatzes angibt, von dem die Festsetzung stammt, wenn sie durch einen der Marktzugangsknoten (MAN) oder der Händlerterminals (WS) empfangen worden ist.

14. Handelssystem nach Anspruch 10, **dadurch gekennzeichnet**, daß der gegenwärtige Kreditrahmen durch ein vorbestimmtes maximales Handelsvolumen und das tatsächliche kumulative Handelsvolumen zwischen dem assoziierten Börsenplatz und einem anderen, mit einer Mehrzahl von Arten von Finanzinstrumenten handelnden Börsenplatz bestimmt wird.

15. Handelssystem nach Anspruch 14, **dadurch gekennzeichnet**, daß der gegenwärtige Kreditrahmen ein kombiniertes Limit ist, das auf eine Mehrzahl von zugehörigen Börsenplätzen anwendbar ist.

16. Handelssystem nach Anspruch 1, **dadurch gekennzeichnet**, daß die Einrichtung zum Verteilen der handelbaren Kurse in Abhängigkeit von einseitigen Kredit-Aktualisierungsmitteilungen arbeitet, die über das Kommunikationsnetzwerk von den einzelnen Börsenplätzen empfangen werden.

Revendications

1. Un système informatisé d'opérations financières pour opérer sur des instruments financiers entre opérateurs qui opèrent à une série de parquets de bourses, appelés simplement parquets ici, ledit système comprenant:

un réseau de communications pour transmettre des messages électroniques
une série de terminaux d'opérateurs (WS) associés chacun à un parquet respectif parmi lesdits parquets (MAN) et connectés au réseau de communications pour

engendrer des messages électroniques de cotations de prix (Quote submit, c'est-à-dire présentation de cotation) incluant des prix d'offres d'achat et/ou de vente (46, 48), et
communiquer une information sélectionnée (24, 26, 18, 20) de prix d'offres d'achat et/ou de vente sur la base de messages de cotation de prix (Présentation de cotation, Quote available, c'est-à-dire cotation disponible, Market view, c'est-à-dire Vue du marché) provenant d'autres desdits parquets et reçus par

l'intermédiaire dudit réseau de communications,

un moyen de traitement (MAN, ARB) d'administration de limites de crédit connecté au réseau de communications, pour déterminer automatiquement si un niveau prédéterminé de crédit est actuellement disponible respectivement (CreditUpdate, c'est-à-dire Mise à jour de crédit) de chaque parquet pour chacun des autres parquets, et

un moyen de traitement (MD) de distribution de prix négociable connecté audit réseau de communications et répondant auxdits messages de cotation de prix (Cotation disponible) ainsi qu'audit moyen de traitement (MAN, ARB) d'administration de limites de crédit pour transmettre automatiquement des messages (Vue du marché) de prix négociable aux terminaux (WS A1b1, WS A1b2) d'au moins un parquet particulier (MAN, A1b), lesdits messages de prix négociable (Vue du Marché) n'étant dérivés que de messages de cotation de prix (Présentation de prix) provenant des parquets (MAN A1a) pour lesquels ledit moyen de traitement (ARB A, MAN A1a, MAN A1b) d'administration de limites de crédit a déterminé que ledit niveau prédéterminé de crédit est actuellement disponible sur une base bilatérale tant à partir dudit parquet particulier (MAN A1b) que pour celui-ci.

2. Le système d'opérations financières selon la revendication 1, dans lequel ladite information sélectionnée de prix communiquée par le terminal situé audit parquet particulier comprend une information (24, 26) de prix négociable dérivée desdits messages de prix négociable (Vue du marché).

3. Le système d'opérations financières selon la revendication 2, dans lequel ladite information (24, 26) de prix négociable comprend le meilleur prix pour une quantité prédéterminée (\$ 5m) disponible de l'un quelconque desdits parquets (MAN) avec lequel un crédit bilatéral existe actuellement.

4. Le système d'opérations financières selon la revendication 3, dans lequel ladite information (24, 26) de prix négociable est le meilleur prix pour ladite quantité prédéterminée (\$ 5 m) disponible comme cotation unique à partir d'un parquet unique parmi lesdits parquets (MAN) avec lesquels un crédit bilatéral existe actuellement.

5. Le système d'opérations financières selon la revendication 3, dans lequel ladite information (24, 26) de prix négociable est déterminée à partir des meilleurs prix pour ladite quantité prédéterminée (\$ 5 m) disponible sur un prix composite basé sur une série de cotations provenant d'un ou plusieurs desdits parquets (MAN) avec lesquels un crédit bilatéral existe actuellement.

6. Le système d'opérations financières selon la revendication 3, dans lequel ladite information de prix négociable comprend en outre le meilleur prix (24, 26) pour une quantité quelconque (28) disponible à partir d'au moins l'un desdits parquets avec lesquels un crédit bilatéral existe actuellement.

7. Le système d'opérations financières selon la revendication 6, dans lequel

des opérations sont possibles pour une petite quantité (28) inférieure à ladite quantité prédéterminée, et ledit terminal affiche un prix (24, 26) applicable seulement à une quantité (28) petite, mais à part cela négociable, lorsque ladite quantité prédéterminée n'est pas disponible au parquet associé.

8. Le système d'opérations financières selon la revendication 1, dans lequel ladite information de prix négociable est communiquée sous la forme d'un affichage visible.

9. Le système d'opérations financières selon la revendication 1, dans lequel ladite information de prix négociable est communiquée à au moins l'un des opérateurs sous la forme d'un texte vocalisé.

10. Le système d'opérations financières selon la revendication 1, qui comprend en outre

une série de noeud d'accès (MAN) connectés au réseau de communications, incluant un premier noeud d'accès (MAN A1a) associé seulement à un premier parquet et un deuxième noeud d'accès (MAN A2a) associé seulement à un deuxième parquet, pour maintenir un enregistrement de toutes les opérations exécutées pour compte d'un parquet associé, et

un ou plusieurs noeuds de distribution (MD) connectés au réseau de communications,

dans lequel

lesdits noeuds d'accès (MAN) comprennent collectivement ledit moyen de traitement d'administration de limites de crédit,

lesdits noeuds de distribution (MD) comprennent collectivement ledit moyen de traitement de distribution de prix négociable,

lesdits noeuds d'accès transmettent auxdits noeuds de distribution, par le réseau de communications, des messages de mise à jour de crédit (Mise à jour de crédit) qui indiquent si ledit niveau prédéterminé de crédit est actuellement disponible d'un parquet à un autre parquet sans indiquer l'ampleur de tout crédit actuellement restant au-dessus dudit niveau prédéterminé,

ledit moyen de traitement de distribution de prix négociable maintient à chacun desdits noeuds de distribution une liste ordonnée (110) d'au moins ceux desdits messages de cotation de prix (Présentation de cotation) qui ne sont pas encore retirés ou réservés et une matrice d'autorisation préalable (PM) dont des entrées individuelles indiquent collectivement si ledit niveau prédéterminé de crédit est ou non disponible sur une base bilatérale entre chacun de ses parquets respectifs et chacun des parquets de ladite série de parquets;

ladite information (108) de prix négociable est transmise de chacun desdits noeuds de distribution à un ou plusieurs desdits noeuds d'accès en vue d'une transmission finale à des terminaux associés parmi lesdits terminaux (WS),

chacun desdits noeuds d'accès (MAN) est situé dans les locaux d'un parquet respectif (TF) et ne contient qu'une information de crédit provenant dudit parquet respectif,

ledit moyen de traitement d'administration de limites de crédit transmet auxdits noeuds de distribution (MD) un message électronique de mise à jour de crédit (Mise à jour de crédit) chaque fois qu'un niveau minimal prédéterminé de crédit devient disponible ou n'est plus disponible à un parquet particulier parmi lesdits parquets, et

ledit message de mise à jour de crédit ne spécifie pas le montant de crédit disponible.

11. Le système d'opérations financières selon la revendication 10, dans lequel les cotations qui concernent un prix qui n'est pas pire qu'un prix particulier parmi lesdits prix négociable et qui provient d'un parquet pour lequel il existe un crédit bilatéral disponible avec le parquet associé audit prix négociable particulier sont identifiés comme "cotations négociable".

12. Le système d'opérations financières selon la revendication 11, dans lequel l'enregistrement d'opérations exécutées maintenu par chaque noeud d'accès est utilisé pour recouvrer, ou rappeler à un état précédent, automatiquement des transactions en attente qui ont été identifiées par un autre noeud comme des opérations potentielles mais qui n'ont pas encore été complètement exécutées ou annulées.

13. Le système d'opérations financières selon la revendication 10, dans lequel

ledit message de cotation de prix (Présentation de cotation) inclut une désignation du parquet (TF) duquel la cotation provient,

ladite désignation de parquet (TF) est utilisée par chacun desdits noeuds de distribution (MD) pour dériver lesdits messages de prix négociable (Vue du marché), et

ledit message de prix négociable n'inclut aucune désignation de l'opérateur ou du parquet dont provient la cotation, lorsqu'il est reçu par un quelconque noeud d'accès de marché (MAN) ou terminal d'opérateur (WS).

14. Le système d'opérations financières selon la revendication 10, dans lequel ladite limite actuelle de crédit est dérivée d'un volume maximal prédéterminé d'opérations et du volume cumulatif réel d'opérations entre ledit parquet associé et un autre parquet négociant dans une série de types d'instruments financiers.

15. Le système d'opérations financières selon la revendication 14, dans lequel ladite limite actuelle de crédit est une limite combinée applicable à une série de parquet liés.

16. Le système d'opérations financières selon la revendication 1, dans lequel ledit moyen de traitement de distribution de prix négociable répond à des messages unilatéraux de mise à jour de crédit reçus des parquets individuels par l'intermédiaire du réseau de communications.
